

Self Study and Exercises from L11 on Node and Graph Classification

1. Use what you have learned and programmed until now – any embedding method with the Karate club dataset. Apply one of the classification methods on top of the embedding you have learned in previous exercises. Test for accuracy and reflect on it.
2. Check for inspiration the node classification colab at:
<https://colab.research.google.com/drive/14OvFnAXggxB8vM4e8vSURUp1TaKnoVzX?usp=sharing>. The colab is provided also with CORA dataset. Note, that the pytorch has Planetoid class which contains both karate club and cora as datasets in the torch format. Run the node classification on that dataset with such a colab notebook or with your adapted implementation. Experiment with number of layers, attentions, convolutions, activation functions and reflect on the accuracy.
3. See whether there are some differences for best performing method different from link prediction.
